

Award Winning Architecture Deserves the Best

The University of Arizona Optical Sciences building received America's highest architectural honor from the American Institute of Architects.

"The University was tasked to find a high quality network video surveillance solution. We were challenged with a complex installation that required high quality video. In addition, we were not looking forward to enabling network cameras streaming high bandwidth video on our network for a number of reasons including the added stress on our network, increased security challenges, as well as the additional IT maintenance. We researched the market extensively and found Smartvue. They were the only company to offer long range 802.11N wireless and high quality/low bandwidth H.264 video compression all in a plug and play "edge" device. This solution solved our requirements to reduce the installation complexity, offer high quality video for our application and reduce the network challenges. Smartvue worked out of the box - we completed the install and were up and running with a multiple camera system in a matter of hours."
